

Fin Receptor System

Finned Structural Attachment Receptors from Thermal Windows, Inc. of Tulsa, Oklahoma have received wide acceptance from the architectural community. The extruded integral fin facilitates bridging of the wall cavity and permits attachment to the structure, while providing a thermally broken platform allowing for easy and secure window installation. The continuous perimeter fin allows for waterproofing techniques not normally afforded by other installation methods. The system is available in two depths providing solutions for masonry façades, exterior insulation finish systems and other building envelope materials. The result is attractive, high-performance waterproofing.
